TACKLING CLIMATE CHANGE:
THINK GLOBALLY, ACT LOCALLY

Associate Professor Shreekant Gupta
LKY School of Public Policy
National University of Singapore
sgupta@nus.edu.sg

BREAKFAST TALK ON ENVIRONMENTAL SUSTAINABILITY
NUS CAMPUS SUSTAINABILITY COMMITTEE
September 9, 2008
Main points

• Climate change is a very real and serious problem
• Global collective action is required to address climate change
• In addition, all of us can (and should) do our bit
• **THINK GLOBALLY, ACT LOCALLY…!**
Outline

• **What is climate change (aka global warming)?**
  • What is the evidence for climate change?
  • Who/What is causing climate change?
  • What are the likely impacts of climate change?
  • What can/should be done to address it?
  • What is the global community doing?
  • What can we do as individuals?
The Greenhouse Effect (1)

- The warming of the atmosphere by heat reflected from the earth is called the **greenhouse effect**.
- The greenhouse effect actually **makes the earth habitable**. Without the greenhouse effect, the earth would be much colder!
- Main greenhouse gases (GHGs) in the atmosphere include CO\(_2\), CH\(_4\), N\(_2\)O, CFCs.
- Increased concentration of GHGs causes more heat to be retained in the atmosphere and more heat to be reflected back to the earth surface and this will lead to a rise in average global temperatures (global warming).
The Greenhouse Effect (2)

- Greenhouse effect is a natural geophysical process, it allows us to exist on earth.

- The gases known as greenhouse gases naturally found in the atmosphere are: water vapour, carbon dioxide, methane, nitrogen oxide, ozone, and chlorofluorocarbons (CFCs).

- These gases trap heat close to the earth’s surface

- Without the greenhouse effect, the earth’s surface temperature would be –180°C!

- The natural greenhouse effect warms the temperature of the atmosphere to 15 °C at the Earth’s surface.

- This natural warming allows water to exist on the Earth’s surface, the basis of life support.
The Greenhouse Effect (3)

[Diagram of the Greenhouse Effect]

Outline

• What is climate change (aka global warming)?
• **What is the evidence for climate change?**
• Who/What is causing climate change?
• What are the likely impacts of climate change?
• What can/should be done to address it?
• What is the global community doing?
• What can we do as individuals?
“Warming of the climate system is unequivocal”

- R.K. Pachauri, Chairman, IPCC
Climate Change?

• IPCC 4th Assessment (February 2007) states:

“Warming of the climate system is unequivocal, as is now evident from observations of increases in global average air and ocean temperatures, widespread melting of snow and ice, and rising global average sea level”

IPCC - scientific basis for climate change

Intergovernmental Panel on Climate Change (IPCC) established in 1988 by United Nations Environment Programme and World Meteorological Organization for assessing "scientific, technical and socioeconomic information relevant for the understanding of the risk of human-induced climate change."

Though IPCC organized within political institutional framework, basically a scientific body—made up of leading scientists from around the world. In order to keep to its scientific mandate and maintain scientific objectivity, IPCC avoids making policy recommendations or shaping research programs.

However, since assessments of IPCC are the most comprehensive and balanced evaluations of climate change, its work is single most important foundation on which climate policy is built
Oslo, 10 December 07
The Intergovernmental Panel on Climate Change
and Albert Arnold (Al) Gore Jr.
were awarded the Nobel Peace Prize
"for their efforts to build up and disseminate greater
knowledge about man-made climate change, and to
lay the foundations for the measures that are
needed to counteract such change".
Changes in global average surface temperature

Outline

• What is climate change (*aka* global warming)?
• What is the evidence for climate change?
• **Who/What is causing climate change?**
• What are the likely impacts of climate change?
• What can/should be done to address it?
• What is the global community doing?
• What can we do as individuals?
Emissions from human activities are increasing the concentration of atmospheric GHGs

Enhanced greenhouse effect occurs due to atmospheric buildup of GHGs that are released by human activities

The main sources of GHG emissions are:

- Burning of fossil fuels (coal, oil, natural gas)
- Industrial activities
- Food production activities
- Burning and exploiting forests
- Waste landfills

The concentration of CO₂ in the atmosphere has increased from 295 parts per million (ppm) in 1870 to 370 ppm in 2000 (next slide..)
Global atmospheric concentration of CO₂

Parts per million (ppm)

370

Sources: TP Whorf, Scripps, Mauna Loa Observatory, Hawaii, Institution of Oceanography (SIO), University of California La Jolla, California, United States, 1999
Why is CO2 rising?
IPPC’s review of latest scientific research concludes “The balance of evidence suggests a discernible human influence on global climate”.

- An increasing body of observations gives a collective picture of a warming world and other changes in the climate system.
- Emissions of greenhouse gases and aerosols due to human activities continue to alter the atmosphere in ways that are expected to affect the climate.
- Confidence in the ability of models to project future climate has increased.
- There is new and stronger evidence that most of the warming observed over the last 50 years is attributable to human activities.
Outline

• What is climate change (aka global warming)?
• What is the evidence for climate change?

Potential Climate Change Impacts

Climate Changes
- Temperature
- Precipitation
- Sea Level Rise

Health Impacts
- Weather-related Mortality
- Infectious Diseases
- Air Quality-Respiratory Illnesses

Agriculture Impacts
- Crop yields
- Irrigation demands

Forest Impacts
- Change in forest composition
- Shift geographic range of forests
- Forest Health and Productivity

Water Resource Impacts
- Changes in water supply
- Water quality
- Increased Competition for water

Impacts on Coastal Areas
- Erosion of beaches
- Inundate coastal lands
- Costs to defend coastal communities

Species and Natural Areas
- Shift in ecological zones
- Loss of habitat and species

United States Environmental Protection Agency
Observed impacts in South Asia

Intense Rains and Floods
- Serious and recurrent floods in Bangladesh, Nepal and N-E India in 2002, 2003 and 2004
- Rainfall in Mumbai (India), 2005: 1 million people lost their homes

Droughts
- 50% of droughts associated with El Niño
- Droughts in Orissa (India) in 2000-2002: crop failures, mass starvation affecting 11 million people

Cyclones / Typhoons
- Increasing intensity of cyclones formation in Bay of Bengal and Arabian Sea since 1970
- Cyclone Nargis in Myanmar, 2008: 100 000 deaths
Impacts on human health

- Endemic morbidity and mortality due to diarrhoeal disease primarily associated with floods and droughts.
- Greater spread and toxicity of cholera due to increase in temperature of coastal water.
- Increased deaths, disease and injury due to heat waves, floods, storms, fires and droughts.
Impacts on food production

**Crop yields** could increase up to 20% in East and Southeast Asia while they could decrease up to 30% in Central and South Asia by 2050.

In India, wheat yields could decrease by **5-10%** per one-degree rise in temperature.
Impacts on water resources

Glacier melt projected to increase flooding, rock avalanches and to affect water resources within the next two to three decades

Salinity of groundwater especially along the coast, due to increases in sea level and over-exploitation

In India, gross per capita water availability will decline from 1820 m$^3$/yr in 2001 to 1140 m$^3$/yr in 2050
Impacts on coastal areas

Coastal erosion and inundation of coastal lowland as sea level continues to rise, flooding the homes of millions of people living in low lying areas. In India, potential impacts of 1 m sea-level rise include inundation of 5,763 km$^2$.

Significant losses of coastal ecosystems, affecting the aquaculture industry, particularly in heavily-populated mega-deltas.
Outline

“the greatest market failure the world has seen”

An unusual externality:

- Effects are global
- Effects persist decades and centuries into the future
- Potentially very large risks (damages)
- High degree of uncertainty regarding both science and economics of climate change
- Irreversible damages and costs of mitigation
Time Lags in Climate Response

Source: IPCC
Costs of Mitigation

• Current CO2e concentration is 430 ppm
• Propose stabilizing CO2e at or below 550 pm
• At 550 ppm, 0.5 probability of < 3°C rise by 2100, and unlikely that rise > 4°C (relative to pre-industrial); under BAU a 0.5 probability of 5°C rise
• Assuming emissions peak in 2020, can achieve 550 pm with annual emissions cuts of 1 – 3% thereafter
• 10 year delay doubles annual rate of emissions decline required
Means of Reducing GHG Emissions

• Increasing efficiency of energy use
• Increasing efficiency of energy production
• Adopting low carbon technologies for power, heat, and transport, including CCS
• Reducing demand for emissions-intensive goods and services
• For non-fossil fuel emissions:
  – reducing deforestation
  – changing agricultural practices
• Augmenting carbon sinks—reforestation and afforestation
Policy Options for Reducing GHG Emissions

• Establishing a *credible* carbon price
• Removing fossil fuel subsidies
• Technology policy—R&D and deployment assistance
• Removing barriers to behavioral change
• “Carbon finance”—financial assistance to developing countries
• Promoting adaptation
• Preserving/augmenting carbon sinks
Importance of Price Signals

Figure 2.3. Aggregate Contributions of Major GHG Emitting Countries

Sources & Notes: WRI, CAIT. Moving from left to right, countries are added in order of their absolute emissions, with the largest being added first. Figures exclude CO₂ from land-use change and forestry and emissions from international bunker fuels.
Global Response

- The First World Climate Conference recognized climate change as a serious problem in 1979.
- A number of intergovernmental conferences focusing on climate change were held in the late 1980s and early 1990s.
- In 1990 IPCC (Panel of 2,500 scientists) released its first assessment report concluding that:
  
  "Climate change is real and human activities are contributing to it."
Global Response and the United Nations Framework Convention on Climate Change

- **UNFCCC** is the basis for global efforts to combat global warming (supported by IPCC).
- The UNFCCC objective is “Stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic human-induced interference with climate system.”
- The Convention sets out some guiding principles:
  - Precautionary principle
  - “Common but differentiated responsibilities”
  - Acknowledge need of developing countries for sustainable development
Signed by 154 countries (plus EC) in 1992 at Rio de Janeiro. To date, 189 countries have ratified the Convention.

The uppermost body of the Convention is the Conference of the Parties (CoP), which is responsible for achieving its objectives.

CoP held its first session in Berlin (Germany) in 1995. The Parties meet every year.

CoP-3 in Kyoto (Japan) in 1997 established the Kyoto Protocol.
The Kyoto Protocol

- An agreement by developed countries to reduce GHG emissions.
- Developed countries have to reduce GHG emissions by 5.2% compared to their 1990 level over the period 2008-2012.
- No targets for developing countries.
- Reduction targets cover 6 main GHGs: CO2, CH4, N2O, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulphur hexafluoride (SF6).
Summary so far…

- Human activities are increasing the concentration of GHGs in the atmosphere.
- The increase of GHG concentration will lead to unprecedented increase in average global temperature.
- Rising temperature are predicted to lead to disruptions in climate patterns, have adverse impacts on food supply, fresh water resources, human health, coastal areas, species and natural areas.
- The international community has worked together to create an agreement on how to address climate change known as the UNFCCC.
- The Convention is a United Nations agreement to stabilize greenhouse gases in the atmosphere, at a level that would prevent dangerous changes to the climate.
- To date, 189 countries have ratified the climate change convention.
- The Kyoto Protocol is the first concrete step toward cutting GHG emissions.
Outline

- What is climate change (*aka* global warming)?
- What is the evidence for climate change?
- Who/What is causing climate change?
- What are the likely impacts of climate change?
- What can/should be done to address it?
- What is the global community doing?
- *What can we do as individuals?*
Thinking globally, acting locally…

• …the journey of a thousand miles begins with one step
• …it is better to light a candle than to curse the darkness
• …”you must be the change you wish to see in the world” (Gandhi)
7 Day Carbon Challenge
(Govt. of Queensland)

• Day 1 – Reduce your waste (reduce, reuse, recycle)
• Day 2 – Switch to green power
• Day 3 – Change your light bulbs (CFLs)
• Day 4 – Check your thermostat!
• Day 5 – Think before you eat (no meat once a week)
• Day 6 – Reduce car travel (bicycle, public transport)
• Day 7 – Economise on water (laundry, etc.)

1.6 billion people lack access to electricity
33% live in India

Enabling a billion lives to access light from solar technologies
Solar lantern

Each solar lantern:

- Saves about 40-60 litres of kerosene per year
- Mitigates 145 kg CO$_2$ emissions per year

Alternately:

- Saves about 182.5 kWhr of electricity per year
- Mitigates 157 kg CO2 emissions per year
Gandhi was once asked if he expected India to attain the same standard of living as Britain. He replied:

*It took Britain half the resources of the planet to achieve this prosperity. How many planets will a country like India require!*
