

Music and Well-being: Leveraging music interventions and technology for health

Dr. Kat Agres

Assistant Professor, YST Conservatory of
Music, National University of Singapore

IPS-NAC Arts and Culture Research Symposium on Arts and Wellness
25 August 2022

My background and research interests

- Examine Music Cognition using interdisciplinary methods (experimental psychology, computational modeling, neuroscience, etc)
- Investigate how musical structure impacts listeners' perception, cognition, and emotional responses
- I also have a background in cello performance
- Develop music-based interventions for health and well-being

The roles of music in society

Music supports Mental Health

Music supports our:

- **Mental health by decreasing anxiety and depression** (Irish, et al., 2006; Khalifa, Bella, Roy, Peretz, & Lupein, 2003; Thaut et al, 2009), for example, relaxing music interventions have been shown to reduce HR, respiratory rate, and state anxiety scores (White, 1992)
- **Emotional Resilience:** Participatory music programs can help foster social and emotional competencies as well as emotional resilience (Daykin, De Viggiani, Moriarty, & Pilkington, 2017), and can even foster resilience in those with serious illness, e.g., undergoing cancer treatment (Docherty et al., 2013)
- **Confidence:** Music-making activities can improve self-esteem and self-confidence in youth/students, victims of abuse, and in adults with mental health conditions (Clendenon-Wallen, 1991; Williams, Dingle, & Clift, 2018)
- **Social well-being:** Participating in musical activities (e.g., choral singing) can improve social bonding and help participants feel a sense of belonging (Williams, Dingle, & Clift, 2018)

Music supports Cognition

- **Improving executive functions:** Neurologic Music Therapy helps cognitive function (Thaut et al, 2009)
- **Pain reduction:** Greater pain reduction (Perlini and Viita, 1996) and greater pain tolerance (Mitchell, et al., 2006) during preferred music listening
- **Transfer effects:** Musical training improves novel word learning (Dittinger, et al, 2016) and verbal recall (Gfeller, 1983; Wallace, 1994; Wolfe & Hom, 1993)
- **Recovery from aphasia (language disorder):** Melodic intonation therapy helps many patients with aphasia recover speech abilities (Altenmüller & Schlaug, 2013)
- **Memory performance:** Music can act as a memory enhancer in Alzheimer patients (Prickett & Moore, 1991; Simmons-Stern, Budson, & Ally, 2010), and can even help patients access non-musical autobiographical memories (Foster & Valentine, 2001; Irish, et al. 2006)

Music supports Motor Function

- **Improvement in movement, motor control, and gait**
 - Musical interventions improve gait in stroke rehabilitation patients (Thaut, McIntosh, & Rice, 1997; Hurt, Rice McIntish, & Thaut, 1998) and Parkinson's patients (see review by Dreu, van der Wilk, Poppe, Kwakkel, & van Wegen, 2012).
 - Musical training can also improve gross and fine motor skills (speed, accuracy, and smoothness of movement) in stroke patients (Schneider, et al, 2010) and hemiparetic arm rehabilitation patients (Yoo, 2009), and musical training has been shown to be more effective than conventional physiotherapy (Schneider, et al, 2010).
- **Motivating adherence:** Music shows promise in helping elderly persons adhere to prescribed PT exercise (Johnson, Otto, & Clair, 2001)
- **Mental practice:** Music and VR has been used to support mental practice of motor movements in stroke patients, leading to improved motor function (Trobia, Gaggioli, & Antonietti, 2011)

Music, Social Cohesion, and Quality of Life

Community music activities

- **Group singing** has been used as an effective social intervention to support mental health. Group singing interventions can **improve emotional states** (increase positive emotions, reduce anxiety, elicit enjoyment), **enhance social bonding**, **increase self-confidence**, and help participants develop a **sense of belonging** (Williams, Dingle, & Clift, 2018)

- **Drumming interventions** have been shown to increase social resilience, decrease depression/anxiety, and significantly improve overall mental wellbeing. Group drumming also facilitates feelings of belonging, acceptance, safety and care, and stimulates new social interactions (Fancourt, Perkins, Ascenso, Carvalho, Steptoe, & Williamon, 2016)

Music technology for healthcare

Where does technology come in?

Music technology for healthcare

Music and technology go hand-in-hand...

Music can be integrated into real-time, interactive MedTech for an engaging, multi-modal, holistic approach to treatment of motor impairment, mental health illnesses, and neurological disorders.

- **Music interventions & technologies:** Engage participants cognitively and physically for a faster recovery time; can be holistic and patient-centric; are non-invasive and non-pharmaceutical; and can reduce costs of medicine, hospitals, and therapists/RNs

**Music, Computing, and Health:
A Roadmap for the Current and Future
Roles of Music Technology
for Health Care and Well-Being**

- We use the term **music technology** as “the umbrella term for software and hardware devices supporting digital means to analyze, process, generate, perform, edit, and interact with music”
- This encompasses:
 - supporting the creation, playing, and recording of music
 - providing feedback through the use of sound and music
 - employing musical interfaces for musical expression and creation
 - analyzing musical data produced within music therapy sessions

Use cases of Music Tech in Health

Music Therapy During COVID-19: Changes to the Practice, Use of Technology, and What to Carry Forward in the Future

 Kat R. Agres^{1*},  Katrien Foubert^{2,3,4} and  Siddarth Sridhar⁵

¹Yong Siew Toh Conservatory of Music, National University of Singapore, Singapore, Singapore

QR code for
the paper:

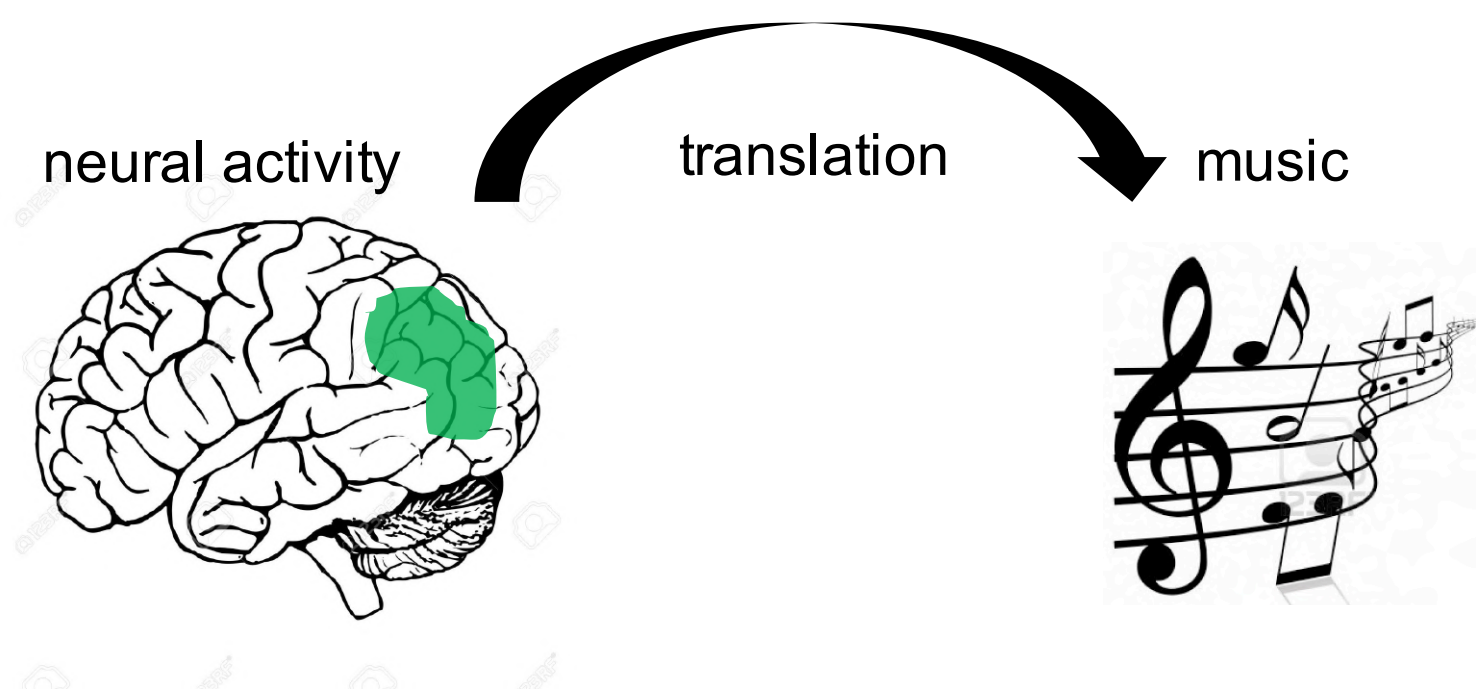

- 87% of music therapists interviewed said they believe there is a **greater need for music therapy**, now due to Covid-19, but 80% had to **see fewer patients** (e.g., due to restrictions, social distancing measures)
- “Music is always about making a connection... and connection is precisely what we tend to lose during this time of isolation and quarantine.”

Music-based BCIs

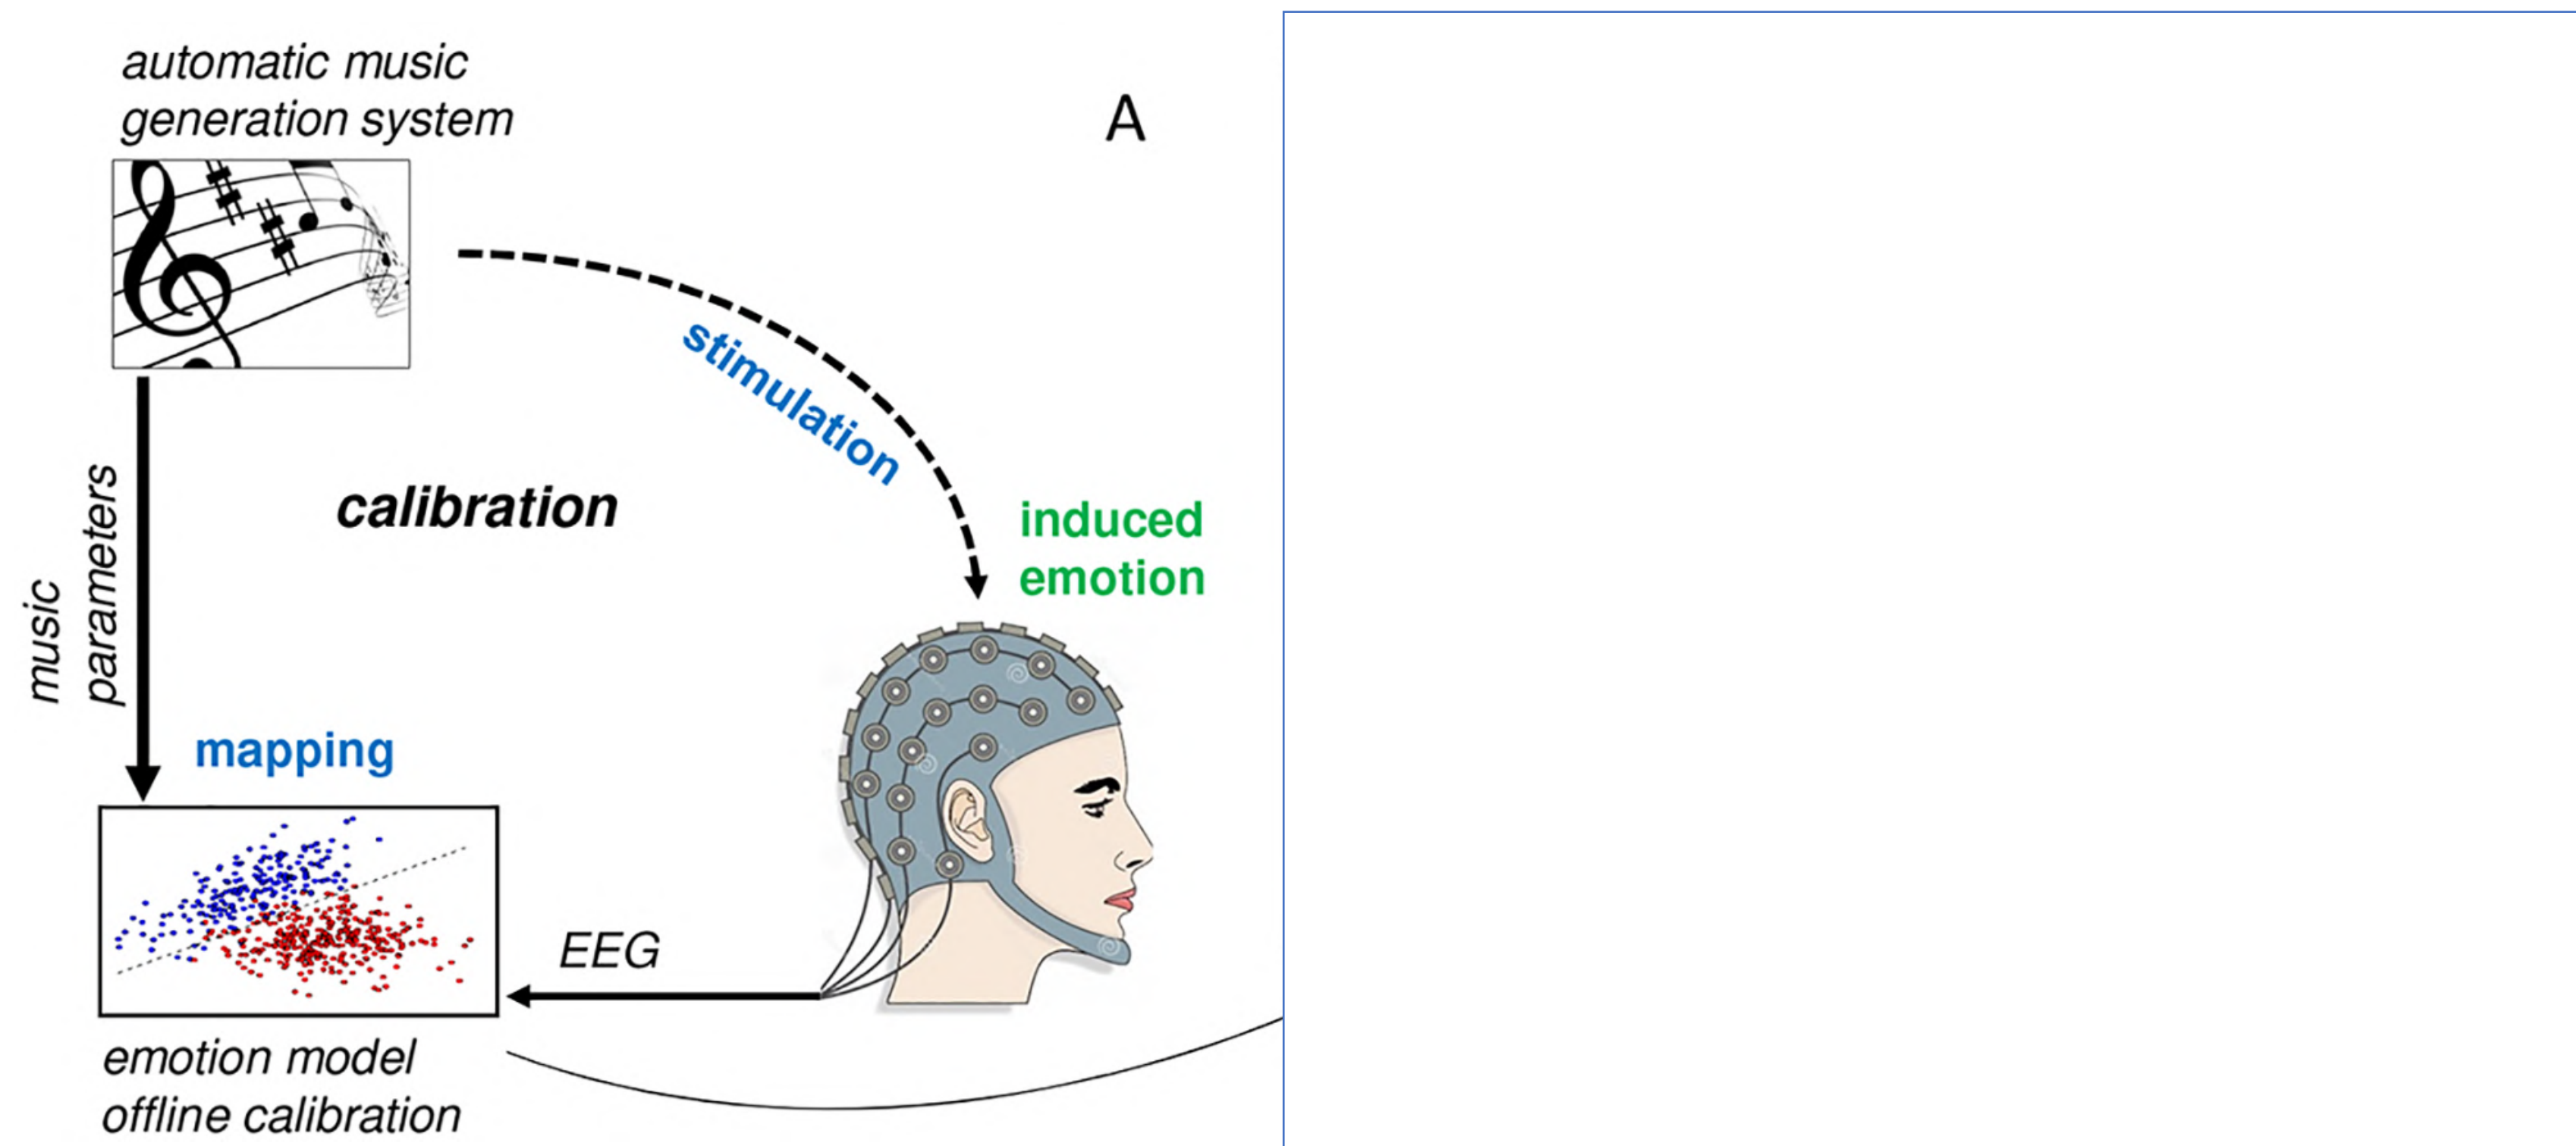

- Different **musical attributes** can lead to differing **physiological and neural responses**
- Real-time automatic music generation can leverage combinations of musical features to **enliven** or **relax listeners** in real time...
 - ...and can be embedded into a BCI system to flexibly generate music in real time to listeners, based on their brain state

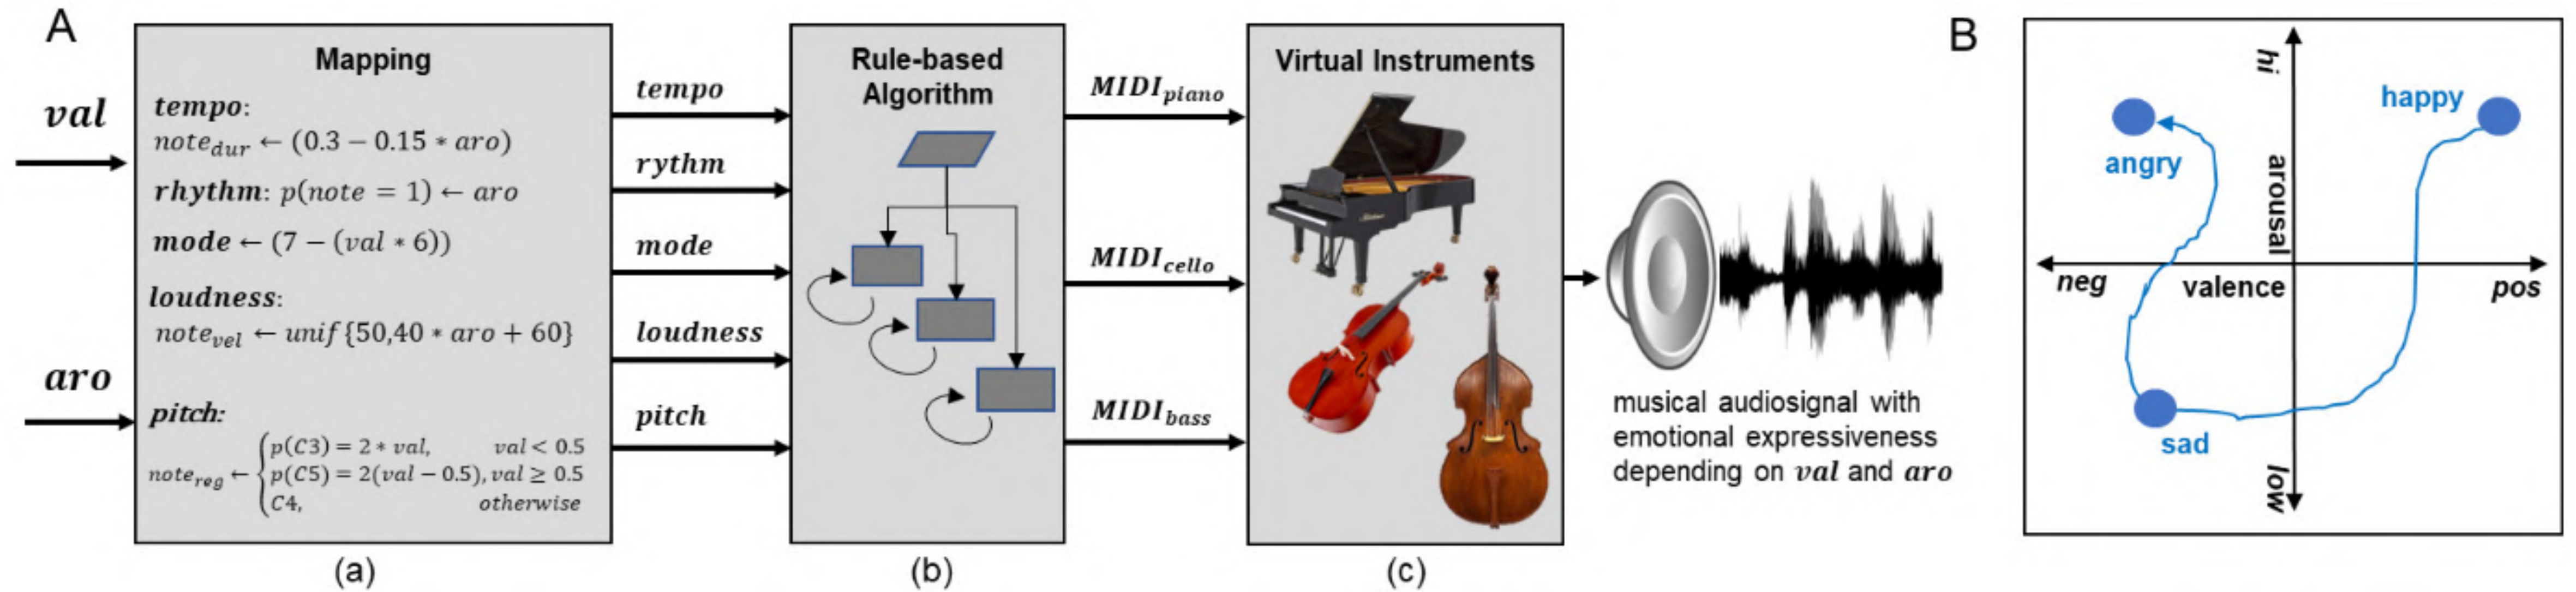

Music-based BCI study

- BCI system that uses algorithmic music generation to capture and influence a person's affective state in real time => **Closed-loop interaction between participant's brain responses and music**

Automatic music generation system

Music generation algorithm:

A. Mapping emotion states (valence and arousal) onto musical parameters, and ultimately translating those MIDI patterns into high quality *affective* music.

B. Example of musical trajectory through affective space (valence-arousal-model; see Russell, 1980)

Music-based BCI study

Brain activity during 'modulate to happy' task

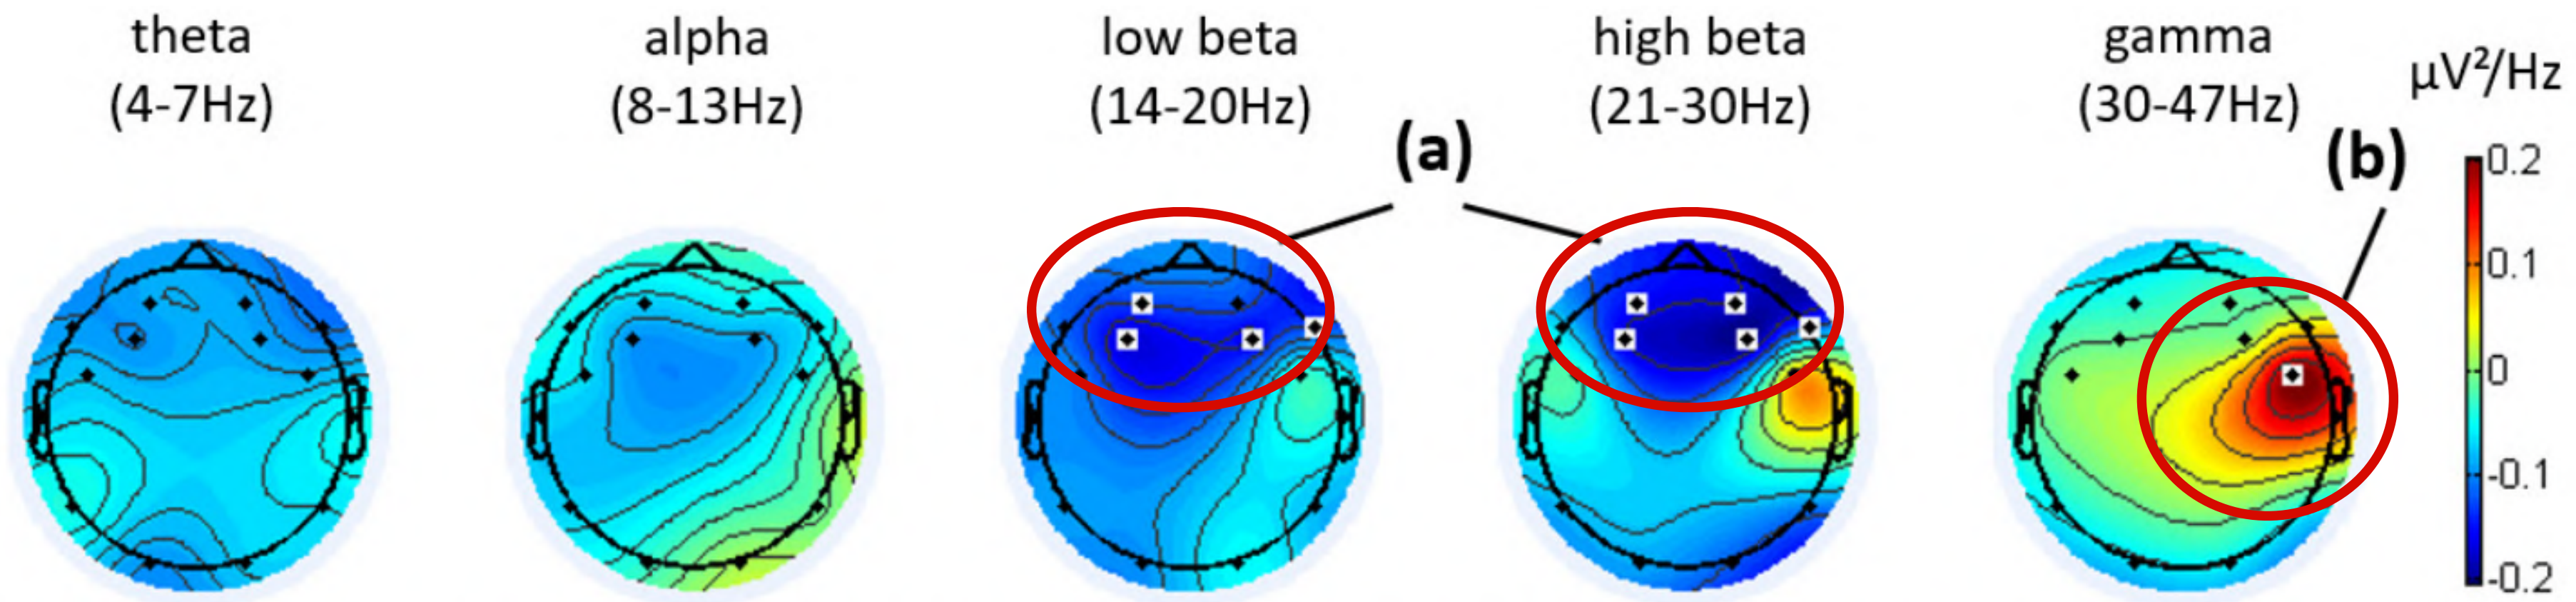

Significant power decrease in beta band over frontal areas (a), and an increase in gamma power over the right hemisphere (b)

Music-based BCI study

Brain activity during 'modulate to happy' task

Takeaway messages:

- Participants were able to change their brain state and modulate the musical feedback by self-inducing emotions!
- **This system enables self-regulation of affective states in listeners:** The system sonifies listener's affective state in real-time, but also gave listeners a tool to mediate their own emotions by interacting with the music

Abstract

Emotions play a critical role in rational and intelligent behavior; a better fundamental knowledge of them is indispensable for understanding higher order brain function. We propose a non-invasive brain-computer interface (BCI) system to feedback a person's affective state such that a closed-loop interaction between the participant's brain responses and the musical stimuli is established. We realized this concept technically in a functional prototype of an algorithm that generates continuous and controllable patterns of synthesized affective music in real-time, which is embedded within a BCI architecture. We evaluated our concept in two separate studies. In the first study, we tested the efficacy of our music algorithm by measuring subjective

Closing thoughts and take-home messages

•🎵 Music & technology for well-being and healthcare

- **Music has many affordances for therapeutic use**, and can help people improve their memory, attention, motor coordination, language abilities, well-being (including mental health), social wellness, and more
- Music can effectively be **embedded within technology to promote health and wellness** in a variety of clinical/therapeutic & non-clinical contexts.
- Increasing use of music technology by music therapists has allowed **greater support of patients** who could not be seen in person **during COVID-19**.

• **Actionable takeaway messages regarding the impact of music (and music technology) on society:**

- **Musicians/arts practitioners**: Music is excellent at bringing people together, bridging communities and creating cohesion, and (even if you don't intend for it) supporting mental health. Make music in and with your communities to form a tighter-knit, healthier society.
- **Academics**: More interdisciplinary research (between academics, musicians/arts practitioners, the tech/AI community, and clinicians) will be helpful to develop bespoke technologies for healthcare.
- **Policy-makers**: Be an advocate for more/diverse funding, resources, and spaces for long-term arts health programs. Sustainable programs are needed for the biggest impact (this is a challenge).
